RADIAL NEEDLE ROLLER AND CAGE ASSEMBLIES

INTRODUCTION

Before selecting specific radial needle roller and cage assemblies, the general Engineering section of this catalog should be reviewed for detailed information concerning:

- bearing type selection
- example of life calculation
- bearing life and reliability
- lubrication
- definition of load ratings
- limiting speeds
- life and load relationships
- shaft design
- effect of raceway hardness
- housing design

In addition to these general considerations, review the material which follows when selecting radial needle roller and cage assemblies.

IDENTIFICATION

The prefix letters in the assembly designation denote whether the Torrington needle roller and cage assemblies are made to inch or metric nominal dimensions.

For example, an assembly with metric nominal dimensions is indicated by the code letter **K** in the prefix. Absence of the letter **K** in the prefix indicates an assembly with inch nominal dimensions.

There are two primary constructions of needle roller and cage assemblies, each of which is made to inch or metric nominal dimensions. The **WJ** (inch) and the **K** (metric) assemblies generally employ larger roller diameters. The **WJC** (inch) assemblies normally employ smaller roller diameters. Also listed are metric needle roller and cage assemblies using molded, one piece reinforced engineered polymer cages with suffix letters **TN**.

Radial Needle Roller and Cage Assemblies
Types K, WJ and WJC

CONSTRUCTION

Torrington needle roller and cage assemblies have a steel cage which provides both inward and outward retention of the needle rollers. The designs provide maximum cage strength consistent with the inherent high load ratings of needle roller bearings.

Torrington also has available one-piece reinforced engineered polymer cages for use where operating conditions permit. Before applying assemblies with engineered polymer cages, please consult Torrington sales engineers.

The controlled contour needle rollers used in these assemblies are made of high carbon chrome steel, through hardened, ground and lapped to close tolerances for diameter and roundness. See the Engineering section of this catalog for further discussion of controlled contour rollers.

DIMENSIONAL ACCURACY

The nominal inch assemblies, **WJ** and **WJC**, contain needle rollers manufactured to only one diameter grade. Any one assembly has needle rollers with a total diameter tolerance of 0.0001 inch (**0.0025 mm**).

Metric needle roller and cage assemblies, **K** are supplied with needle roller complements subdivided into groups shown in Table 1, the groups being at Torrington's option if nothing to the contrary is agreed upon at the time of ordering.

The limit to precision of the radial clearance of mounted needle roller and cage assemblies is the capability of the user to hold close tolerances on the inner and outer raceways.

The tolerance of the over-all width of these assemblies is given on the tabular pages of this section.

Table 1
Needle Roller Group Limits (Grade G2)

μm		inches	Identifying color on package	
0	-2	0	-0.00008	red
-1	-3	-0.00004	-0.00012	
-2	-4	-0.00008	-0.00016	blue
-3	-5	-0.00012	-0.00020	
-4	-6	-0.00016	-0.00024	gray
-5	-7	-0.00020	-0.00028	

MOUNTING DIMENSIONS

The cage and needle roller assembly normally uses the shaft and housing as the inner and outer raceways, respectively. In order to realize full bearing load rating and life, the shaft and housing must have the correct geometric and metallurgical characteristics.

The tables of dimensions for these assemblies list the recommended diameters for the shaft when used as the inner raceway. Additional design details for shafts used as inner raceways can be found in the general Engineering section of this catalog.

Since the housing normally serves as the outer raceway, it should be of sufficient cross section to maintain adequate roundness and running clearance under load. The tables of dimensions also list the recommended diameters for the housings when used as outer raceways. Additional design details for housings used as outer raceways can be found in the general Engineering section of this catalog.

The recommended mounting diameters for both nominal inch and nominal metric needle roller and cage assemblies will provide correct running clearance for most applications.

The needle roller and cage assembly must be axially located by shoulders or other suitable means. End locating surfaces should be hardened to minimize wear. For satisfactory operation, minimum axial clearance should be 0.008 inch (**0.2 mm**). When using types **WJ** assemblies adjacent fillets must not exceed 0.03 inch (**0.8 mm**) radius. When it is necessary to use fillets adjacent to **WJC** and **K** assemblies, please consult the Torrington Engineering Sales Office for recommendations.

LUBRICATION

Oil is the preferred lubricant for most applications. In critical applications involving high speeds, ample oil flow must be provided. Where assemblies are subjected to high centrifugal forces, such as in epicyclic gearing, or inertial forces as in the small end of a connecting rod, the contact pressure between the cage and the raceway guiding surface becomes critical. The allowable contact pressure depends on a combination of the induced force and the rubbing velocity between the cage and raceway and the rate of lubricant flow. Consult the Torrington Engineering Sales Office when cages will be subjected to high induced forces.

SPECIAL DESIGNS

Needle roller and cage assemblies made to special dimensions or configurations, such as those which are split to assemble around a one-piece crankshaft, can be made available upon special order where quantities permit. Special plated or coated cages to enhance life under conditions of high induced forces can also be made available.

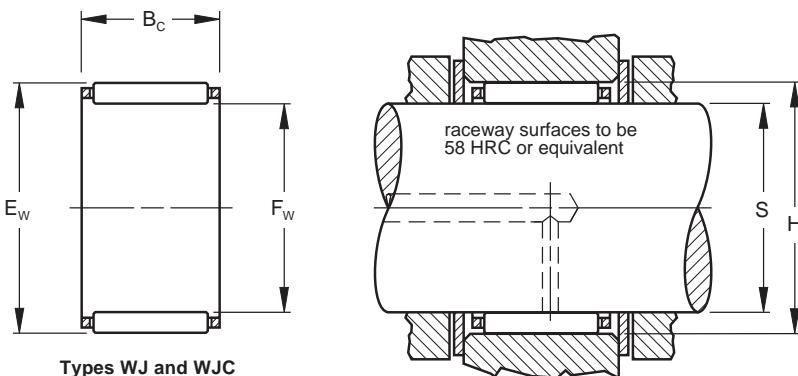

RADIAL NEEDLE ROLLER AND CAGE ASSEMBLIES

Type WJC

Check for availability.

Inch - metric conversions given are for the convenience of the user.

The controlling dimensions are in inches for nominal inch bearings and in millimeters for nominal metric bearings.

Load ratings are given in pounds-force: 1 lbf = 0.454 kgf = 4.448 N

Required Basic Dynamic Load Rating (C_r) = Applied Load • SF • LF • HF (see page E75).

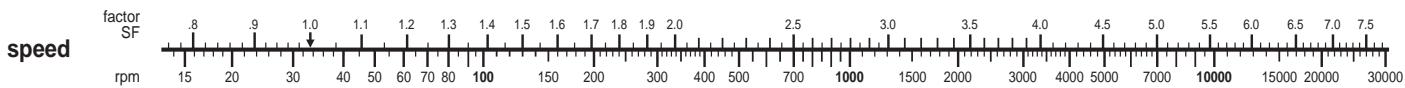

Limiting speeds listed on this page are based on adequate oil lubrication.

T Symbol denotes Torrington Basic Dynamic Load Rating to be used in load-life calculations taking into consideration the application guidelines and limitations given in this catalog. Applications involving loads approaching this rating should be referred to the Torrington Engineering Sales Office before a final selection is made.

Load Ratings are based on a minimum raceway hardness of 58 HRC or equivalent.

Mounting - The recommended shaft and housing bore diameters listed above are essential to the proper application of the needle roller and cage assemblies. Proper mounting requires that all surfaces adjacent to the assemblies must have a hardness equivalent to 58 HRC, minimum. The raceway with the lower hardness determines the ability of the assembly to carry the load.

Minimum axial clearance should be .008 inches or 0.2 mm.

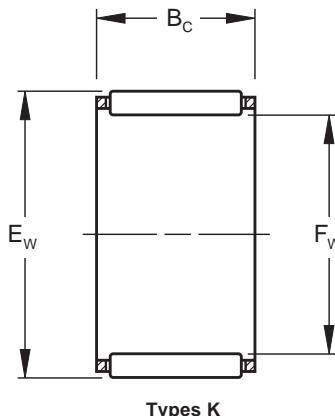

Type K

Check for availability.

Inch-metric conversions given are for the convenience of the user.

The controlling dimensions are in inches for nominal inch bearings and in millimeters for nominal metric bearings.

Load ratings are given in pounds-force: 1 lbf = 0.454 kgf = 4.448 N

Required Basic Dynamic Load Rating (C_r) = Applied Load • SF • LF • HF (see page E75).

Limiting speeds listed on this page are based on adequate oil lubrication.

T Symbol denotes Torrington Basic Dynamic Load Rating to be used in load-life calculations taking into consideration the application guidelines and limitations given in this catalog. Applications involving loads approaching this rating should be referred to the Torrington Engineering Sales Office before a final selection is made.

Load Ratings are based on a minimum raceway hardness of 58 HRC or equivalent.

Mounting - The recommended shaft and housing bore diameters listed above are essential to the proper application of the needle roller and cage assemblies. Proper mounting requires that all surfaces adjacent to the assemblies must have a hardness equivalent to 58 HRC, minimum. The raceway with the lower hardness determines the ability of the assembly to carry the load.

Minimum axial clearance should be .008 inches or 0.2 mm.

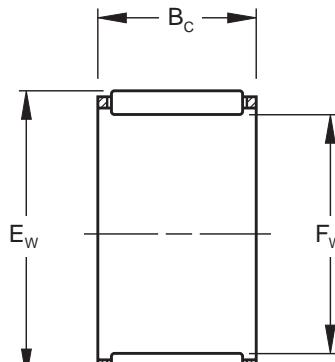

Type K (continued)

Check for availability.

Inch-metric conversions given are for the convenience of the user.

The controlling dimensions are in inches for nominal inch bearings and in millimeters for nominal metric bearings.

Load ratings are given in pounds-force: 1 lbf = 0.454 kgf = 4.448 N

Required Basic Dynamic Load Rating (C_r) = Applied Load • SF • LF • HF (see page E75).

Limiting speeds listed on this page are based on adequate oil lubrication.

T Symbol denotes Torrington Basic Dynamic Load Rating to be used in load-life calculations taking into consideration the application guidelines and limitations given in this catalog. Applications involving loads approaching this rating should be referred to the Torrington Engineering Sales Office before a final selection is made.

Load Ratings are based on a minimum raceway hardness of 58 HRC or equivalent.

Mounting - The recommended shaft and housing bore diameters listed above are essential to the proper application of the needle roller and cage assemblies. Proper mounting requires that all surfaces adjacent to the assemblies must have a hardness equivalent to 58 HRC, minimum. The raceway with the lower hardness determines the ability of the assembly to carry the load.

Minimum axial clearance should be .008 inches or 0.2 mm.

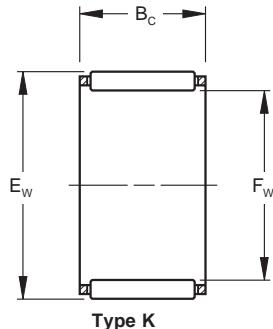

Type K (continued)

Check for availability.

Inch-metric conversions given are for the convenience of the user.

The controlling dimensions are in inches for nominal inch bearings and in millimeters for nominal metric bearings.

Applications involving loads approaching this rating should be referred to our engineering department before a final selection is made.

Load Ratings are based on a minimum raceway hardness of 58 HRC or equivalent.

RADIAL NEEDLE ROLLER AND CAGE ASSEMBLIES

Type WJ (continued)

Check for availability.

Inch-metric conversions given are for the convenience of the user.

The controlling dimensions are in inches for nominal inch bearings and in millimeters for nominal metric bearings.

Load ratings are given in pounds-force: 1 lbf = 0.454 kgf = 4.448 N

Required Basic Dynamic Load Rating (C_r) = Applied Load • SF • LF • HF (see page E75).

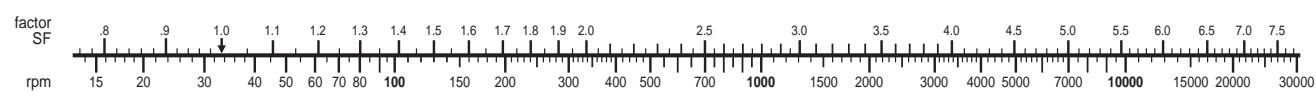

Limiting speeds listed on this page are based on adequate oil lubrication.

T Symbol denotes Torrington Basic Dynamic Load Rating to be used in load-life calculations taking into consideration the application guidelines and limitations given in this catalog. Applications involving loads approaching this rating should be referred to the Torrington Engineering Sales Office before a final selection is made.

Load Ratings are based on a minimum raceway hardness of 58 HRC or equivalent.

Mounting - The recommended shaft and housing bore diameters listed above are essential to the proper application of the needle roller and cage assemblies. Proper mounting requires that all surfaces adjacent to the assemblies must have a hardness equivalent to 58 HRC, minimum. The raceway with the lower hardness determines the ability of the assembly to carry the load.

Minimum axial clearance should be .008 inches or 0.2 mm.

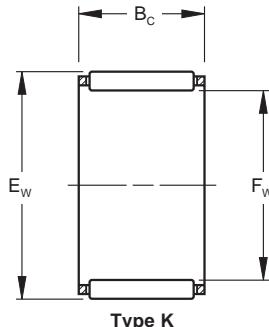

Type K (continued)

Check for availability.

Inch-metric conversions given are for the convenience of the user.

The controlling dimensions are in inches for nominal inch bearings and in millimeters for nominal metric bearings.
